# Symmetry in Chemistry - Assignment 1 

Due date: April 11, 2021
(For each solution, show your work through a set of important steps)

1. Identify the symmetry elements in cubane (assume all H atoms are along the body diagonals). (3 Pts)

Fig 1. Molecular structure of cubane
2. For an improper rotation with an odd order, how many unique symmetry operations can be generated? (2 Pts)
3. What do these combination of symmetry operations represent? (4 pts)
(a) $\mathrm{S}_{4}^{2}(\mathrm{z}) \cdot \mathrm{i}$
(b) $\mathrm{C}_{8}^{2}(\mathrm{z}) \cdot \mathrm{C}_{4}^{1}(\mathrm{z}) \cdot \sigma_{\mathrm{xy}}$
(c) $\sigma_{\mathrm{xy}} \cdot \sigma_{\mathrm{yz}} \cdot \sigma_{\mathrm{xz}} \cdot \mathrm{C}_{8}^{1}(\mathrm{z})$
(d) $\mathrm{C}_{4}^{1}(\mathrm{z}) \cdot \mathrm{C}_{2}^{1}(\mathrm{z}) \cdot \mathrm{S}_{2}^{1}(\mathrm{x})$
4. Verify the validity of all five commutation rules using specific examples of symmetry operations. (5pts)
5. Derive a general matrix representation of a reflection operation that is carried out using a mirror plane containing the z-axis; the mirror plane can be arbitrarily oriented w.r.t to the x and and y -axis. (4 pts)
6. A point $(1,-1,2)$ in a 3 D Cartesian space is subjected to a clockwise rotation about the y-axis by an angle of $45^{\circ}$ followed by a reflection about the xz-plane. Locate the point in the space. Also, check if the transformation represents any of symmetry operations. (2 pts)
